All documents cited herein are incorporated by reference in their entirety.

TECHNICAL FIELD

This invention relates to compounds useful in mass spectrometry.

5 BACKGROUND OF THE INVENTION

It is known that triphenylmethyl derivatives readily form ions. However, there remains a need for alternative and improved compounds which readily form ions and which are useful in mass spectrometry.

DISCLOSURE OF THE INVENTION

10 The invention provides compounds of formula (IIa):

where:

X is a group capable of being cleaved from the α -carbon atom to form an ion of formula (I')

15 C \star is a carbon atom bearing a single positive charge or a single negative charge;

M is independently a reactive functional group;

Ar¹ is independently an aromatic group or an aromatic group substituted with one or more A;

Ar² is independently an aromatic group or an aromatic group substituted with one or more A;

20 optionally wherein (a) two or three of the groups Ar¹ and Ar² are linked together by one or more L⁵, where L⁵ is independently a single bond or a linker atom or group; and/or (b) two or three of the groups Ar¹ and Ar² together form an aromatic group or an aromatic group substituted with one or more A;

A is independently a substituent;

L_M is independently a single bond or a linker atom or group;

25 n = 0, 1 or 2 and m = 1, 2, or 3, provided the sum of n+m = 3;

p independently = 1 or more; and

q independently = 1 or more.

The invention further provides compounds of formula (IIb):

where:

X^\star is a counter-ion to C^\star ;

and C^\star , M, Ar^1 , Ar^2 , L_M , n, m, p and q are as defined above.

The compounds of formula (IIa) and (IIb) may form ions of formula (I') by either cleaving the C-X
5 bond between X and the α -carbon atoms in the case of the compounds of formula (IIa) or dissociating X^\star in the case of compounds of formula (IIb).

Ions of formula (I') are stabilised by the resonance effect of the aromatic groups Ar^1 and Ar^2 . Electron-withdrawing groups, when C^\star is an anion, or electron-donating groups, when C^\star is a cation, may optionally be provided on Ar^1 and/or Ar^2 to assist this resonance effect.

10 The compounds of formula (IIa) and (IIb) are useful in the methods disclosed in UK patent application GB 03 284 14.8.

Solid Supports

The invention also provides solid supports of formula (IVai), (IVaii) or (IVaiii):

where:

X, Ar^1 , Ar^2 , L_M , M, n, m, p and q are as defined above;

S_S is a solid support;

20 C--- S_S comprises a cleavable bond between C and S_S ;

S_S --- Ar^1 comprises a cleavable bond between Ar^1 and S_S ; and

The cleavable bond of C--- S_S , S_S --- Ar^1 or S_S --- Ar^2 may be a covalent, ionic, hydrogen, dipole-dipole or van der Waals bond.

The solid supports of formula (IVai), (IVaii) and (IVaiii) may form ions of formula (I'):

(a) for modified solid supports of formula (IVai) by cleaving the C-S_S bond between the α-carbon atom of the modified solid support of formula (IVai) and the solid support S_S to form the ion of formula (I');

5 (b) for modified solid supports of formula (IVaii) by, either simultaneously or sequentially, cleaving the C-X bond between X and the α-carbon atom and cleaving the S_S- -Ar¹ bond between the solid support and the Ar¹ group to form the ion of formula (I'); or

(c) for modified solid supports of formula (IVaiii) by, either simultaneously or sequentially, cleaving the C-X bond between X and the α-carbon atom and cleaving the S_S- -Ar² bond between the solid support and the Ar² group to form the ion of formula (I').

The invention also provides solid supports of formula (IVbii) or (IVbiii):

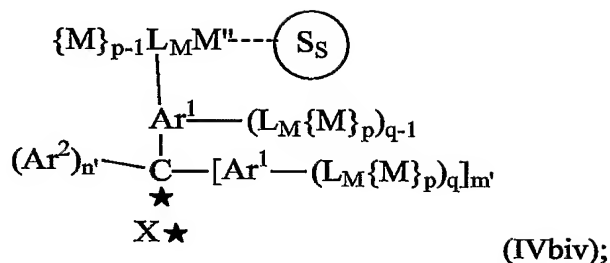

where: X★, Ar¹, Ar², L_M, M, n, m, p, q, S_S, C--S_S, S_S--Ar¹ and S_S--Ar² are as defined above.

15 The solid supports of formula (IVbii) and (IVbiii) may form ions of formula (I'):

(a) for modified solid supports of formula (IVbii) by, either simultaneously or sequentially, dissociating X★ from the derivative of formula (IVbii) and cleaving the S_S- -Ar¹ bond between the solid support and the Ar¹ group to form an ion of formula (I'); or

(b) for modified solid supports of formula (IVbiii) by, either simultaneously or sequentially, dissociating X★ from the derivative of formula (IVbiii) and cleaving the S_S- -Ar² bond between the solid support and the Ar² group to form an ion of formula (I').

The invention also provides solid supports of formula (IVaiv) or (IVbiv):

where:

X, X★, Ar¹, Ar², L_M, M, p, q, n, m, and S_S are as defined above;

5 M''--S_S comprises a bond between M'' and S_S; and

M'' is the same as M except that S_S is bound to a portion of M which does not form part of the residue of M'' remaining attached to the ion of formula (I') which residue is produced after reaction of group M''.

10 In this embodiment of the invention, the solid support is bound to a part of group M'' which does not go on to form part of the residue of M'' remaining attached to the ion of formula (I') which residue is produced after reaction of group M''.

The solid supports of formula (IVai), (IVaii), (IVaiii), (IVbii), (IVbiii), (IVaiv) and (IVbiv) are useful in the methods disclosed in UK patent application GB 03 284 14.8.

Group M

The group M is a reactive functional group. Reactive functional groups include groups capable of reacting to form a covalent linkage and groups capable of ionic bonding, hydrogen bonding, dipole-

The group M is bound to L_M by one or more covalent bonds (e.g. 2 or 3 bonds, especially 2 such

as , which are either single, double or triple covalent bonds (preferably single bonds). Preferably, M is bound to L_M by one single bond.

20 Alternatively, or in addition, M is bound by more than one L_M , such L_M either being attached to the same or different Ar^1 or Ar^2 . In a preferred embodiment M is bound by more than one L_M from different Ar^1 or Ar^2 , e.g.:

Ionic Bonding

Where group M is a reactive functional group capable of ionic bonding, group M typically comprises one or more chelating ligands.

Suitable chelating ligands which can bind anions include polyamines and cryptands.

15 Suitable chelating ligands which can bind cations include polyacidic compounds (e.g. EDTA) and crown ethers.

Hydrogen Bonding

Where group M is a reactive functional group capable of hydrogen bonding, M will typically bear one or more hydroxy, amino or thio hydrogen atoms or a group bearing an atom having one or more lone pair of electrons (e.g. an oxygen, sulphur or nitrogen atom).

Preferred groups capable of hydrogen bonding include biotin, avidin and streptavidin.

Dipole-Dipole Bonding

Where group M is a reactive functional group capable of dipole-dipole bonding, the dipole-dipole bond may be formed between permanent dipoles or between a permanent dipole and an induced dipole.

Preferred groups M capable of dipole-dipole bonding comprise acid groups, or $-(NMe_3)^+$, carboxy, carboxylate, phosphate or sulphate groups.

Where group M is a reactive functional group capable van der Waals bonding, M will typically comprise a hydrocarbyl or heterohydrocarbyl group (usually a large hydrocarbyl group having at least ten carbon atoms up to about 50 carbon atoms), optionally substituted with one or more A. Polyfluorinated hydrocarbyl and heterohydrocarbyl groups are particularly preferred. Typically, the hydrocarbyl or heterohydrocarbyl groups are aryl or heteroaryl groups or groups of the formula

Preferably, these groups are linked to a hydrocarbylene group (*e.g.* C_{1-8} alkylene group) which forms L_M or a part thereof.

10 Group M''

M'' is the same as M except that S_S is bound to a portion of M which does not form part of the residue of M'' remaining attached to the ion of formula (I') which residue is produced after reaction of group M'' . Thus, M'' is a residue of M formable by the conjugation of M and S_S . However, M'' need not necessarily be formed by the conjugation of M and S_S .

- 15 $M''-S_S$ comprises a covalent, ionic, dipole-dipole, hydrogen, or van der Waals bond. The covalent, ionic, hydrogen, dipole-dipole or van der Waals bond may be direct between M'' and S_S or may be provided by one or more binding groups present on M'' and/or S_S .

In addition to the above definition of D^M , D^M may also be C_{1-8} heterohydrocarbylene or C_{1-8} heterohydrocarbylene substituted with one or more A. In this embodiment,

When two or three of the groups Ar¹ and Ar² together form an aromatic group or an aromatic group substituted with one or more A, the aromatic group may be a carbocyclic aromatic group or a carbocyclic aromatic group in which one or more carbon atoms are each replaced by a hetero atom. Typically, in an aromatic group in which one or more carbon atoms are each replaced by a hetero atom, up to three carbons are so replaced, preferably up to two carbon atoms, more preferably one carbon atom.

Preferred hetero atoms are O, Se, S or N, more preferably O, S or N.

When two or three of the groups Ar¹ and Ar² together form an aromatic group or an aromatic group substituted with one or more A, preferred aromatic groups are C₈₋₅₀ aromatic groups.

The aromatic groups may be monocyclic aromatic groups (e.g. radicals of suitable valency derived from benzene), fused polycyclic aromatic groups (e.g. radicals of suitable valency derived from naphthalene) and unfused polycyclic aromatic groups (e.g. monocyclic or fused polycyclic aromatic groups linked by a single bond, a double bond, or by a $-(CH=CH)_r-$ linking group, where r is one or more (e.g. 1, 2, 3, 4 or 5).

Substitution of Ar^1 and Ar^2 – Anions and Cations

When C^\star is a cation, A is preferably an electron-donating group, including $-R^1$ or $-Z^1R^1$, where R^1 and Z^1 are defined below. Preferably, R^1 is C_{1-8} hydrocarbyl, more preferably C_{1-8} alkyl, especially methyl. Z^1 is preferably O, S or NR^1 . R^1 may be substituted with one or more S_{ub}^2 , but is preferably unsubstituted. When C^\star is a cation, A is preferably $-OMe$ (e.g. compound 55a), $-SMe$ (e.g. compounds 53a, 53b, 53c, 53d & 53e), $-N(Me)_2$ (e.g. compounds 54a, 54b & 54c) or Me (e.g. compound 58a). When C^\star is a cation, A, when an electron-donating group, is preferably provided (especially in relation to Ar^1 or Ar^2 being phenyl) in a position ortho or para to C^\star , preferably para. Furthermore, when C^\star is a cation, A, when an electron-withdrawing group (e.g. F (e.g. compound 57a)), is preferably provided (especially in relation to Ar^1 or Ar^2 being phenyl) in a position meta to C^\star . Thus, preferred groups Ar^1 and Ar^2 are as follows:

When C^\star is an anion, A is preferably an electron-withdrawing group, including halogen, trihalomethyl, $-NO_2$, $-CN$, $-N^+(R^1)_2O^-$, $-CO_2H$, $-CO_2R^1$, $-SO_3H$, $-SOR^1$, $-SO_2R^1$, $-SO_3R^1$, $-OC(=O)OR^1$, $-C(=O)H$, $-C(=O)R^1$, $-OC(=O)R^1$, $-C(=O)NH_2$, $-C(=O)NR^1_2$, $-N(R^1)C(=O)OR^1$, $-N(R^1)C(=O)NR^1_2$, $-OC(=O)NR^1_2$, $-N(R^1)C(=O)R^1$, $-C(=S)NR^1_2$, $-NR^1C(=S)R^1$, $-SO_2NR^1_2$, $-NR^1SO_2R^1$, $-N(R^1)C(=S)NR^1_2$, or $-N(R^1)SO_2NR^1_2$, where R^1 is defined below. When C^\star is an anion, A, when an electron-withdrawing group, is preferably provided (especially in relation to Ar^1 or Ar^2 being phenyl) in a position ortho or para to C^\star , preferably para. Furthermore, when C^\star is an anion, A, when an electron-donating group, is preferably provided (especially in relation to Ar^1 or Ar^2 being phenyl) in a position meta to C^\star .

The group A may also comprise one or more isotopes of the atoms making up group A (e.g. example 60), thus, as discussed in more detail below, allowing the masses of the compounds of the invention to be varied. Preferred isotopes are ^{13}C , ^{18}O and ^2H . When providing a series of compounds which differ only in their masses, ^{13}C and ^{18}O are particularly preferred as ^2H atoms may cause a substantial change in the chemical properties of the compound due to the kinetic isotope effect.

Solid Supports

'Solid supports' for use with the invention include polymer beads, metals, resins, columns, surfaces (including porous surfaces) and plates (e.g. mass-spectrometry plates).

The solid support is preferably one suitable for use in a mass spectrometer, such that the invention can be conveniently accommodated into existing MS apparatus. Ionisation plates from mass spectrometers are thus preferred solid supports, e.g. gold, glass-coated or plastic-coated plates. Solid gold supports are particularly preferred.

Varying the mass of compounds of the invention

Within the general formulae (I), (IIa), (IIb), (IIIa), (IIIb), (IVai), (IVaii), (IVaiii), (IVaiv), (IVbii), (IVbiii), (IVbiv), (Vai), (Vaii), (Vaiii), (Vaiv), (Vbii), (Vbiii) and (Vbiv), there is much scope for variation. There is thus much scope of variation in the mass of these compounds.

The masses of the compounds of the invention can be varied via L_M , Ar^1 and/or Ar^2 . Preferably, the masses of the compounds of the invention are varied by varying A on the groups Ar^1 and/or Ar^2 .

In this aspect of invention, compounds of the invention advantageously comprise one or more of F or I as substituents A of the groups Ar^1 , Ar^2 or Ar^3 . F and I each only have one naturally occurring isotope, ^{19}F and ^{127}I respectively, and thus by varying the number of F and I atoms present in the structure of the compounds, can provide a series of molecular mass labels having substantially identical shaped peaks on a mass spectrum.

Compounds of the invention may also include one or more ^2H atoms, preferably as a substituent A or a part thereof of the groups L_M , Ar^1 , Ar^2 or Ar^3 (in particular L_M), in order to vary the masses of the compounds of the invention. The compounds of the invention may include isotopes of ^{13}C and ^{18}O , preferably as a substituent A or a part thereof of the groups L_M , Ar^1 , Ar^2 or Ar^3 (in particular Ar^1 , Ar^2 or Ar^3), in order to vary the masses of the compounds of the invention. Compounds comprising ^2H , ^{13}C and ^{18}O may also be used to provide a series of molecular mass labels having substantially identical shaped peaks on a mass spectrum, by varying the number of ^2H , ^{13}C and ^{18}O atoms present in the structure of the compounds. When providing a series of compounds which differ only in their masses, ^{13}C and ^{18}O are particularly preferred as ^2H atoms may cause a substantial change in the chemical properties of the compound due to the kinetic isotope effect.

In order to increase the molecular mass of the compounds of the invention and to increase the number of available sites for substitution by A, especially F and I, one or more of Ar^1 and Ar^2 may

be substituted by one or more dendrimer radicals of appropriate valency, either as substituent A or group L_M.

Preferred dendrimer radicals are the radicals obtained from the dendrimers of US 6,455,071 and PAMAM dendrimers.

The word "substantially" does not exclude "completely" e.g. a composition which is "substantially free" from Y may be completely free from Y. Where necessary, the word "substantially" may be omitted from the definition of the invention.

5 Example 1

- 3-(4-Bromophenyl)propionic acid.** 4-Bromobenzaldehyde (92.5 g, 0.50 mol) and Meldrum's acid (72.0 g, 0.50 mol) were dissolved in triethylamine-formic acid reagent (1.5 L) and the mixture was refluxed for 20 h, then diluted with water (4 L) and acidified with 6N HCl (1 L) until pH reached 2.
- 10 The precipitated solid was filtered off, washed with diluted HCl, and dissolved in 5% NaHCO₃. The aqueous salt solution was washed with ether (4x400 mL), filtered and acidified with diluted HCl. The resulting 3-(4-bromophenyl)propionic acid was filtered off and dried *in vacuo* over KOH and P₄O₁₀, yield 69.4 g (60 %). The compound was pure according to NMR. R_f 0.33 (CHCl₃-EtOAc, 9:1). An analytical sample was crystallized from toluene and showed mp 134°C. NMR (DMSO-*d*₆): 9.52 (br.
- 15 s, 1H, OH); 8.00 (d, 2H, $J = 8.1$ Hz, ArH); 7.73 (d, 2H, $J = 8.1$ Hz, ArH), 3.41 (t, 2H, $J = 7.5$ Hz, ArCH₂), 3.14 (t, 2H, $J = 7.5$ Hz, CH₂CO).

ABSTRACT

DERIVATISED MOLECULES FOR MASS SPECTROMETRY

Compounds of formula (IIa):

5 are provided where:

X is a group capable of being cleaved from the α -carbon atom to form an ion of formula (I')

C \star is a carbon atom bearing a single positive charge or a single negative charge;

The invention further provides compounds of formula (IIb):

10

where:

X \star is a counter-ion to C \star .

The compounds of formula (IIa) and (IIb) may form ions of formula (I') by either cleaving the C-X bond between X and the α -carbon atoms in the case of the compounds of formula (IIa) or

15 dissociating X \star in the case of compounds of formula (IIb).
